

## Assignment-7: Hosting a website on EC2

### Procedure:

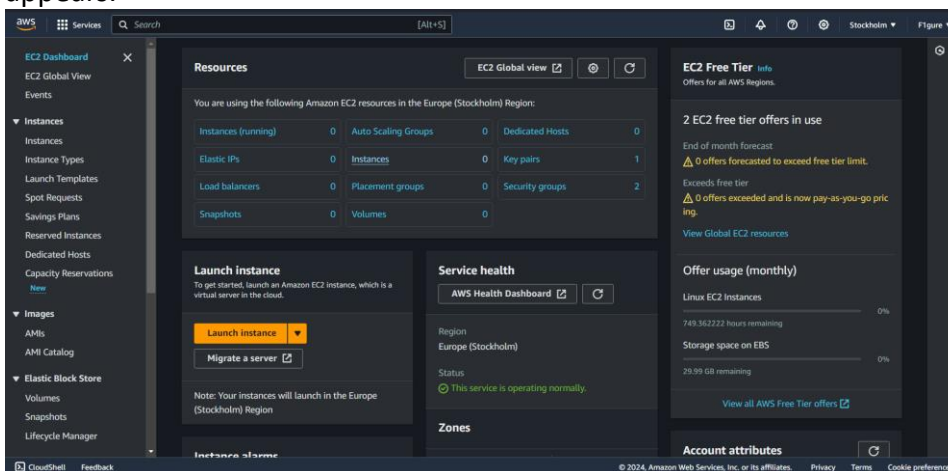

- First switch on your AWS console

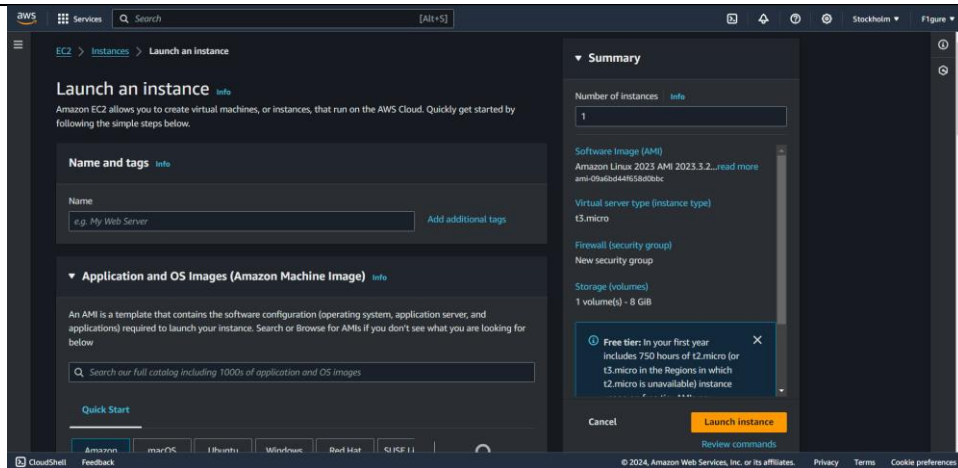

- Now in the search bar search for “EC2”.

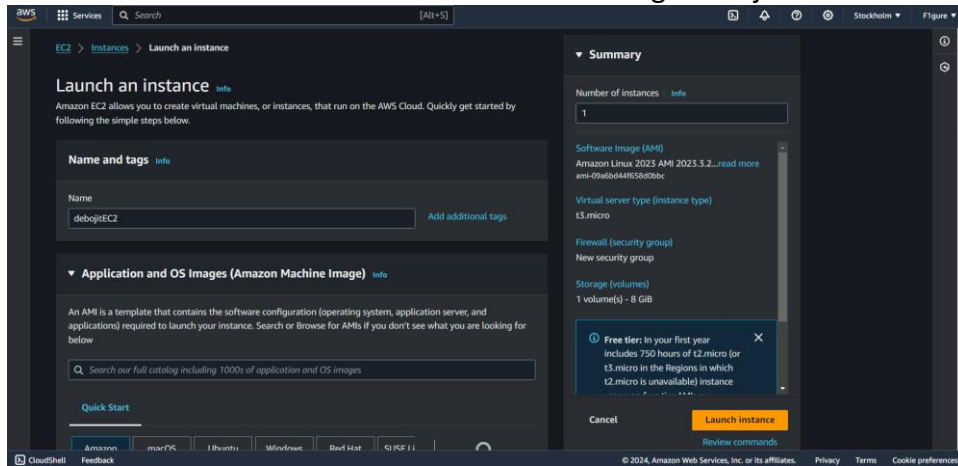

- Now click on the first search result “EC2”. Then you will see the following page appears.

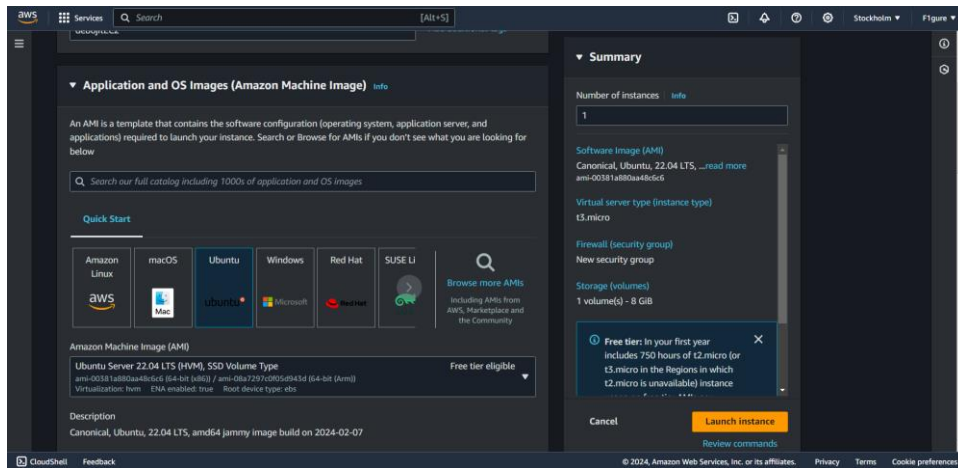

- Now click on “Launch Instance”. Then you will see the following page appears.

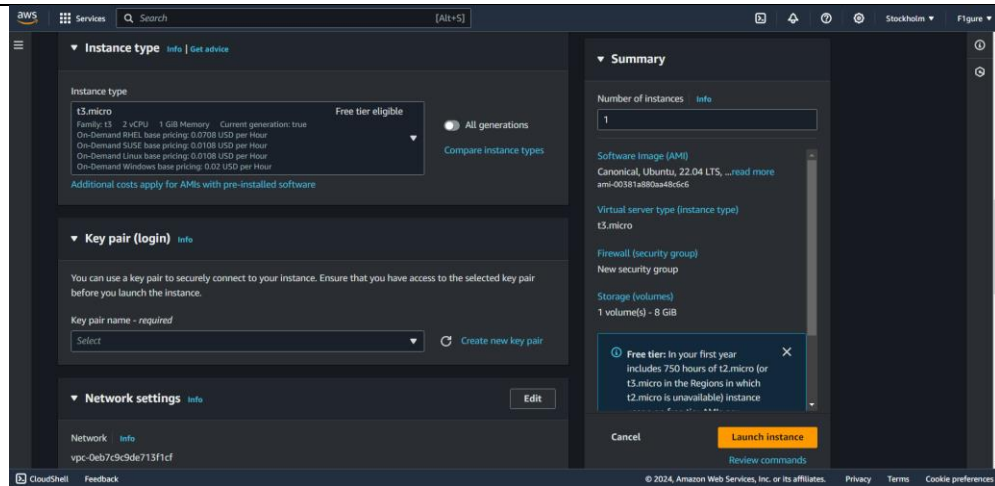

- Now enter a name of the server. Here we are using “debojitEC2” as the name.

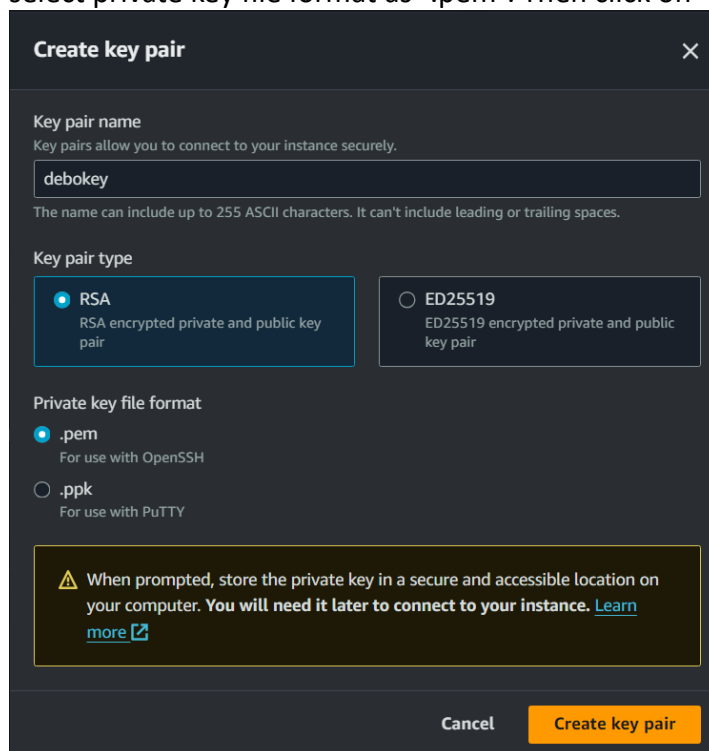

- Now scroll down and select “ubuntu”.

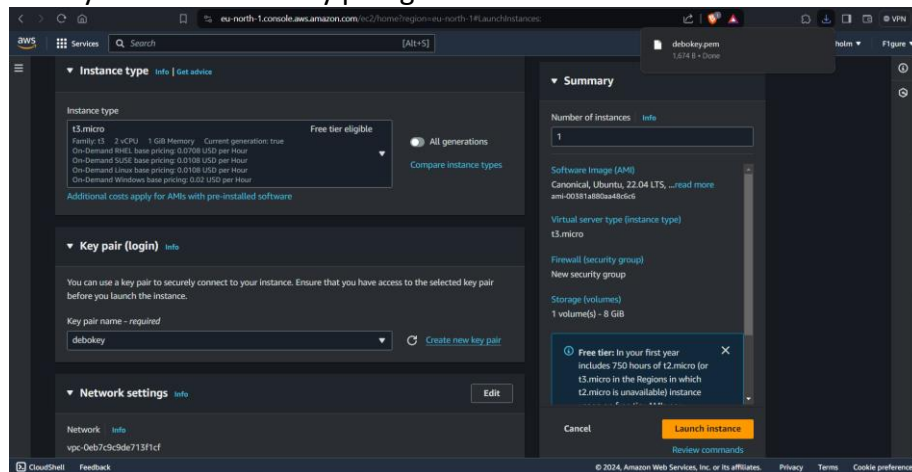

- Now scroll down in place of Key Pair select “Create new Key pair”.

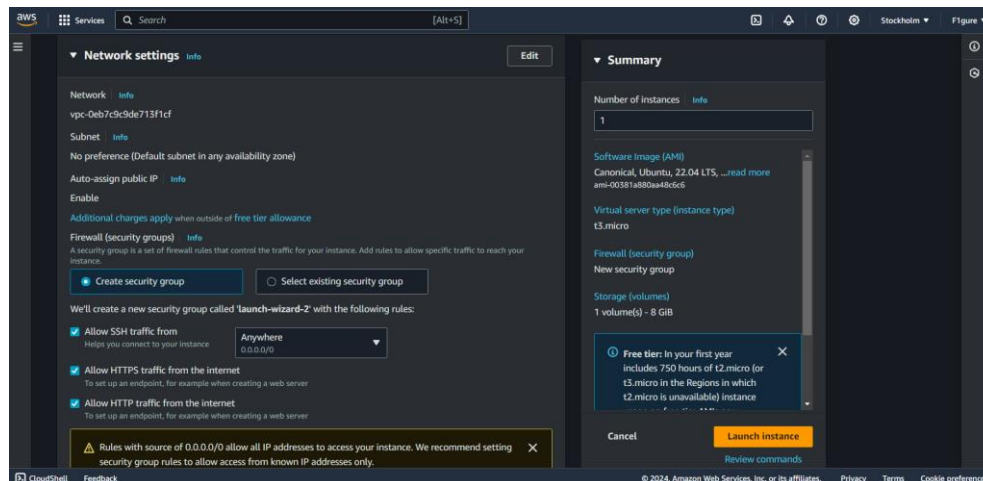

- Now enter a key pair name [Here: “debokey”]. Select key pair type as RSA. Then select private key file format as “.pem”. Then click on “Create Key Pair”.

- Then you will see the key pair got downloaded.

- Now in “Network Settings” select create security group checkbox and select all the check box below it as shown in the screenshot. Then click on “Launch Instance”

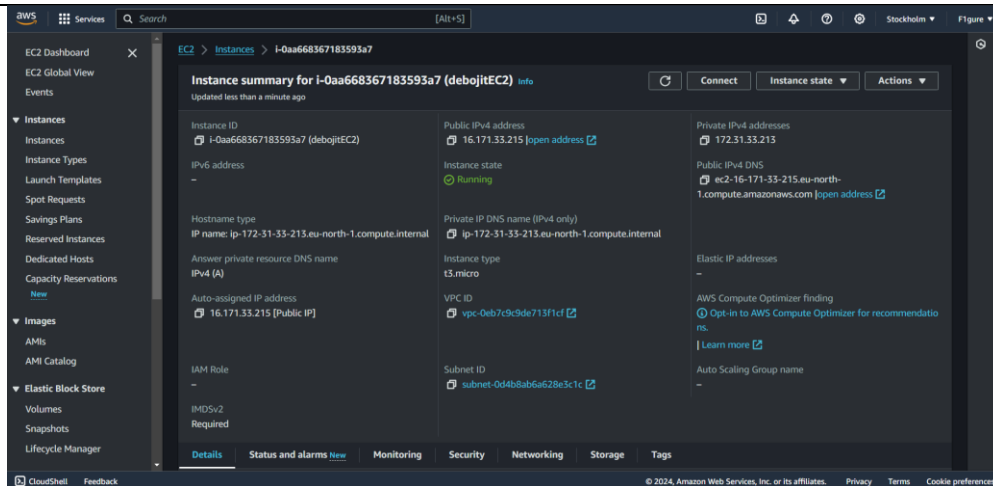

- Then you will see a message appears showing the instance has been launched.

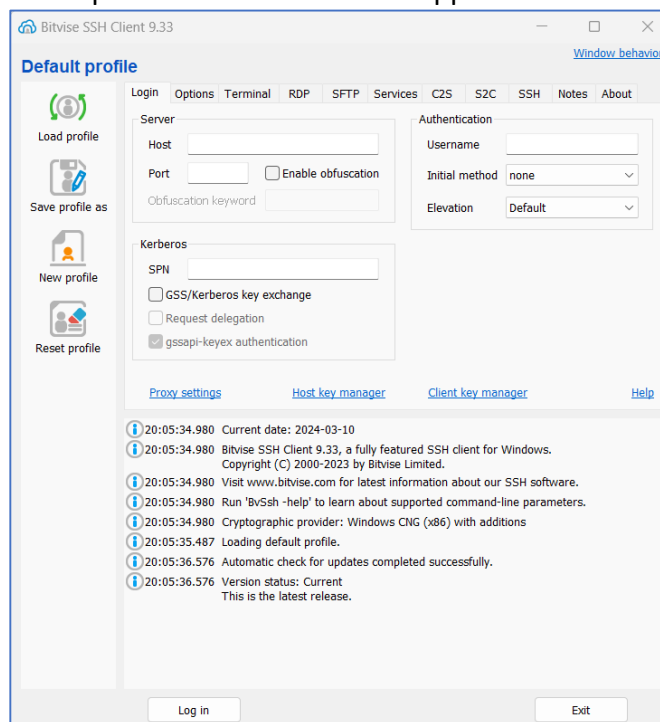

- Now go back to the instance page

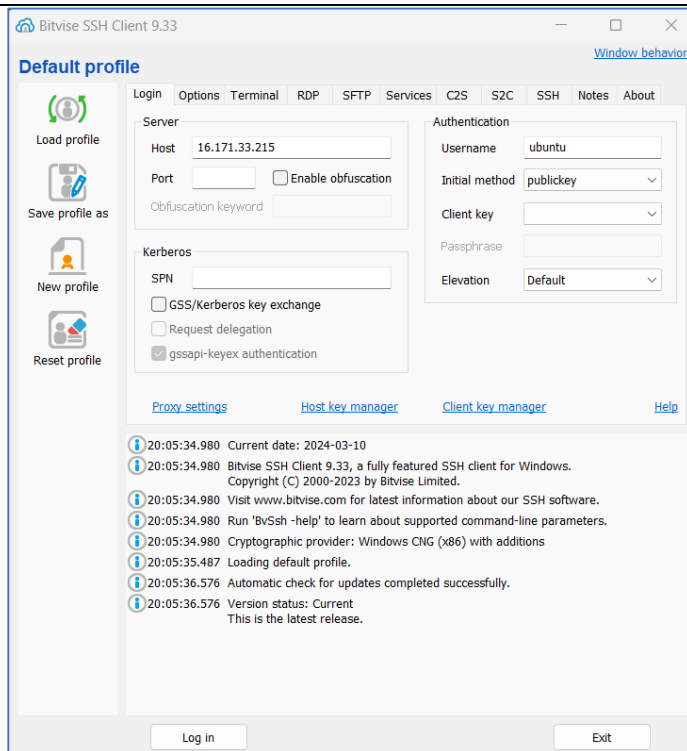

- Now click on the instance ID then you will see the following page appears.

- Now open the bitwise ssl client application

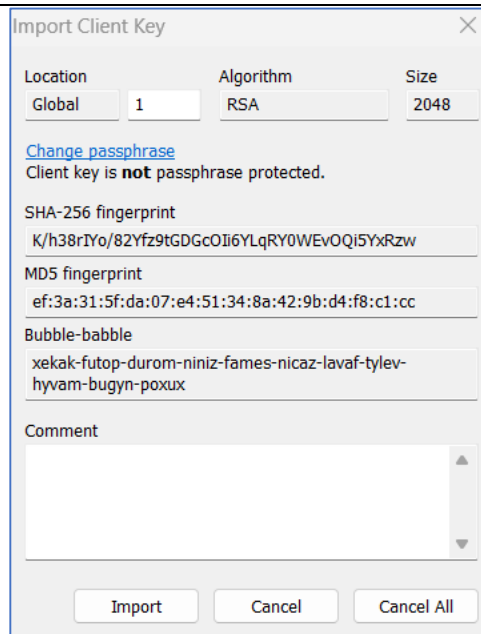

- Now in host enter the IP address, then in username use “ubuntu”, then in initial method select public-key.

- Click on “Client Key Manager”. Then the following window appears.

- Then click on Import and import the key that was generated.
- A pop up appears click on “Import”

Import Client Key

Location: Global    Algorithm: 1    RSA    Size: 2048

[Change passphrase](#)  
Client key is **not** passphrase protected.

SHA-256 fingerprint  
K/h38rIYo/82Yfz9tGDGcOI6YLqRY0WEvOQi5YxRzw

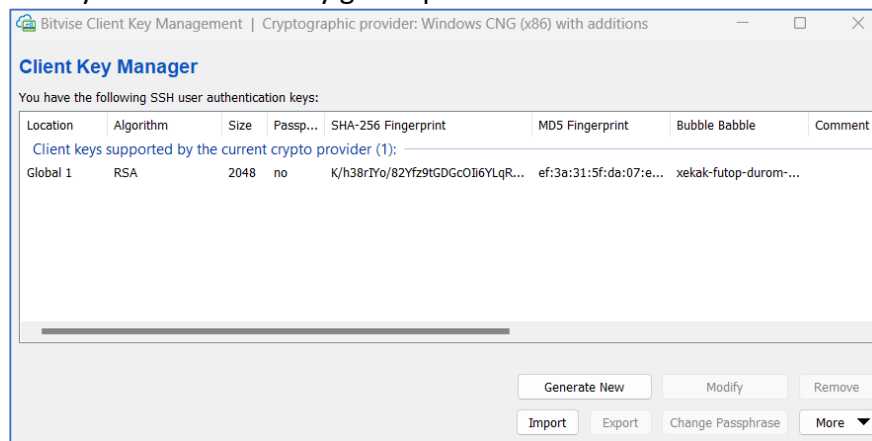

MD5 fingerprint  
ef:3a:31:5f:da:07:e4:51:34:8a:42:9b:d4:f8:c1:cc

Bubble-babble  
xekak-futop-durom-niniz-fames-nicaz-lavaf-tylev-hyvam-bugyn-poxux

Comment

Import    Cancel    Cancel All

- Then you will see the key got imported.

Bitvise Client Key Management | Cryptographic provider: Windows CNG (x86) with additions

**Client Key Manager**

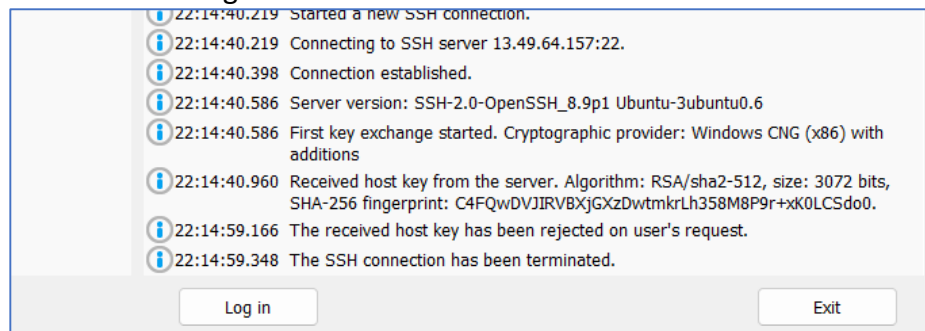

You have the following SSH user authentication keys:

Location	Algorithm	Size	Passp...	SHA-256 Fingerprint	MD5 Fingerprint	Bubble Babble	Comment
Client keys supported by the current crypto provider (1):							
Global 1	RSA	2048	no	K/h38rIYo/82Yfz9tGDGcOI6YLqR...	ef:3a:31:5f:da:07:e...	xekak-futop-durom-...	

Generate New    Modify    Remove

Import    Export    Change Passphrase    More ▼

- Now click on “Log In”

22:14:40.219 Started a new SSH connection.

22:14:40.219 Connecting to SSH server 13.49.64.157:22.

22:14:40.398 Connection established.

22:14:40.586 Server version: SSH-2.0-OpenSSH\_8.9p1 Ubuntu-3ubuntu0.6

22:14:40.586 First key exchange started. Cryptographic provider: Windows CNG (x86) with additions

22:14:40.960 Received host key from the server. Algorithm: RSA/sha2-512, size: 3072 bits, SHA-256 fingerprint: C4FQwDVJIRVBXjGxzDwtmkrLh358M8P9r+xxK0LCSdo0.

22:14:59.166 The received host key has been rejected on user's request.

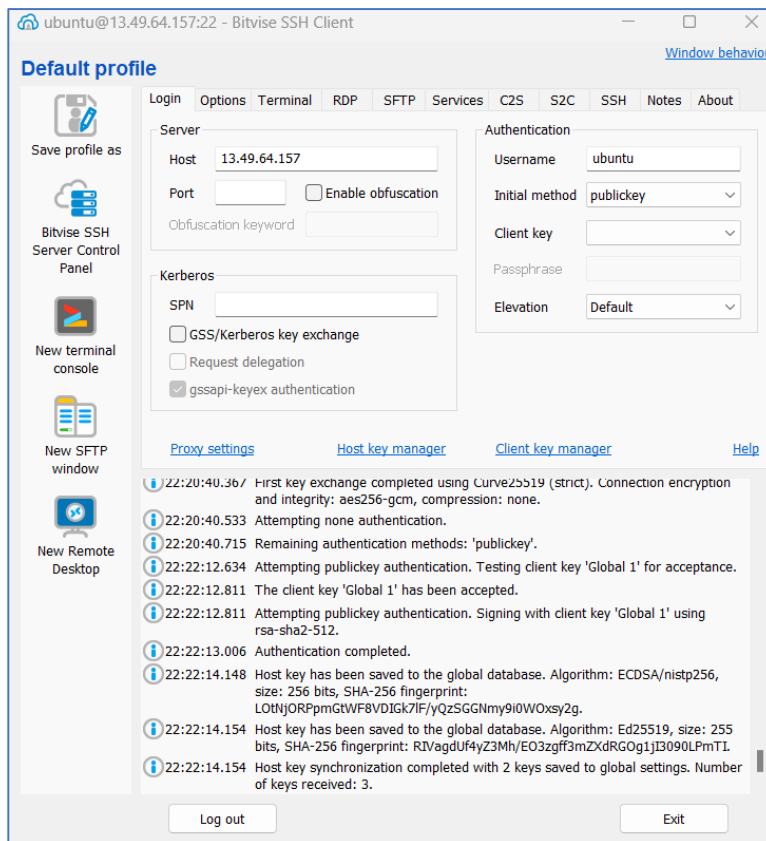

22:14:59.348 The SSH connection has been terminated.

Log in    Exit

- Then a pop-up appears click on “Accept and Save”

- Again, a pop-up appears select the client-key as “Global 1” and click on “OK”.
- Now click on “New terminal console”

- Then the following window will appear.

```
ubuntu@16.171.33.215:22 - Bitvise xterm - ubuntu@ip-172-31-33-213: ~

```

- Then a pop-up will appear then click on OK.

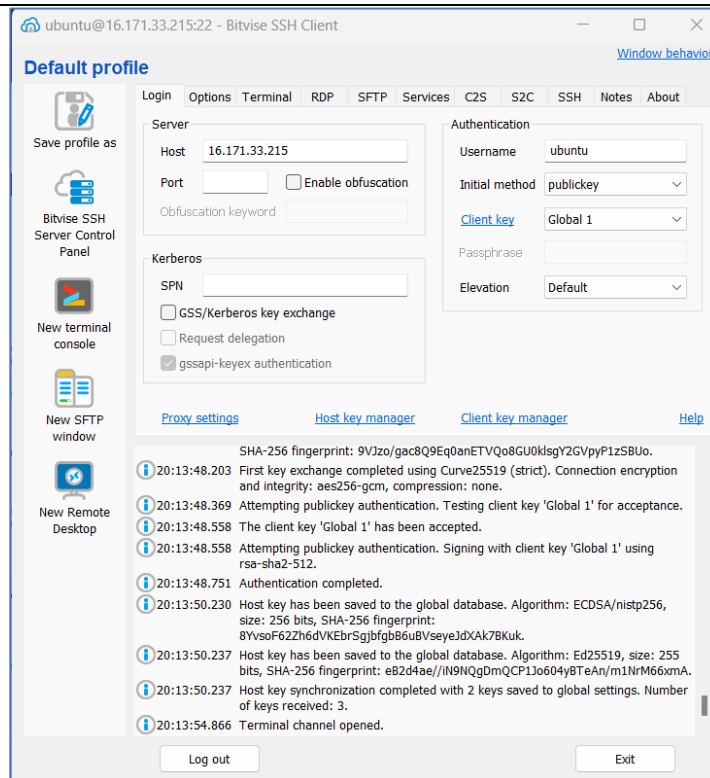

- Then use command: “nginx -v” to check the version of the nginx server.

```

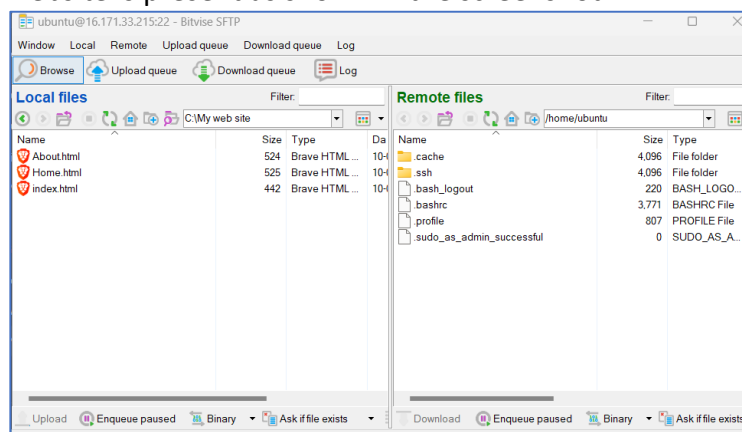

ubuntu@ip-172-31-33-213:~$ nginx -v
nginx version: nginx/1.18.0 (Ubuntu)
ubuntu@ip-172-31-33-213:~$

```

- Now click on “New SFTP Window”

- Then you will see a window opens. In that search and open the folder where your website is present as shown in the screenshot.

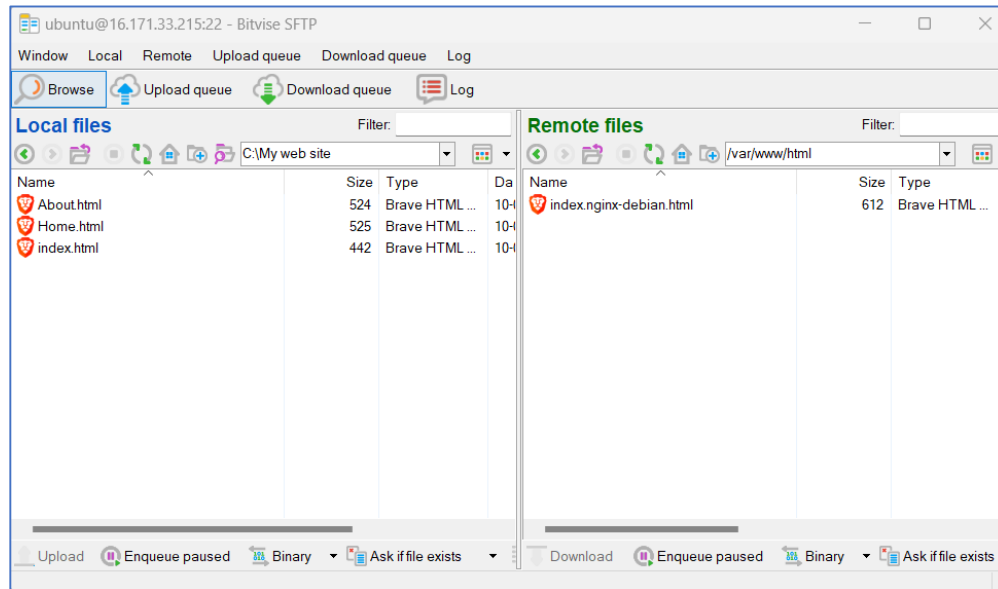

- Now open the terminal and use command: "cd /" to move to the root directory.  

```
ubuntu@ip-172-31-33-213:~$ cd /
ubuntu@ip-172-31-33-213:/$
```
- Now use command: "cd /var/www/". Then use command "ls -l" to view the files along with their permissions.  

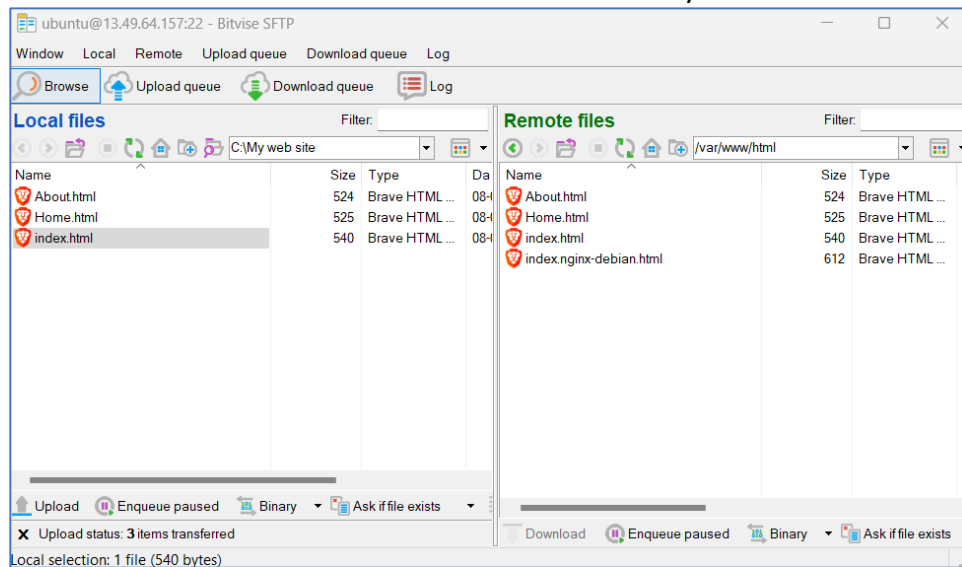

```
ubuntu@ip-172-31-33-213:/$ cd /var/www
ubuntu@ip-172-31-33-213:/var/www$ ls -l
total 4
drwxr-xr-x 2 root root 4096 Mar 10 14:48 html
ubuntu@ip-172-31-33-213:/var/www$
```
- Now use command: "sudo chmod 777 html" to give all permissions to the directory. Then use "ls -l" command to check it.

```
ubuntu@ip-172-31-33-213:/var/www$ sudo chmod 777 html
ubuntu@ip-172-31-33-213:/var/www$ ls -l
total 4
drwxrwxrwx 2 root root 4096 Mar 10 14:48 html
```

- Now again open the sftp window and open the directory “/var/www/html” in ubuntu.

- Now move all the html files into the ubuntu directory.

- Now open the public IP address on your browser you will see the webpage appearing.
